

**Omnis Suite: Bridging No-Code and Pro Code**

ODC 2024, Birgit Jäger

**What does  
Omnis noCode  
offer Omnis Studio  
developers?**

# The target groups of Omnis noCode

1. Small and medium businesses (SMBs)
2. Independent Software Vendors (ISVs) – VARs
3. Public Authorities
4. Start-ups

# Omnis noCode & Omnis Studio

Each app built in Omnis noCode is an Omnis Studio library with clean and commented code.

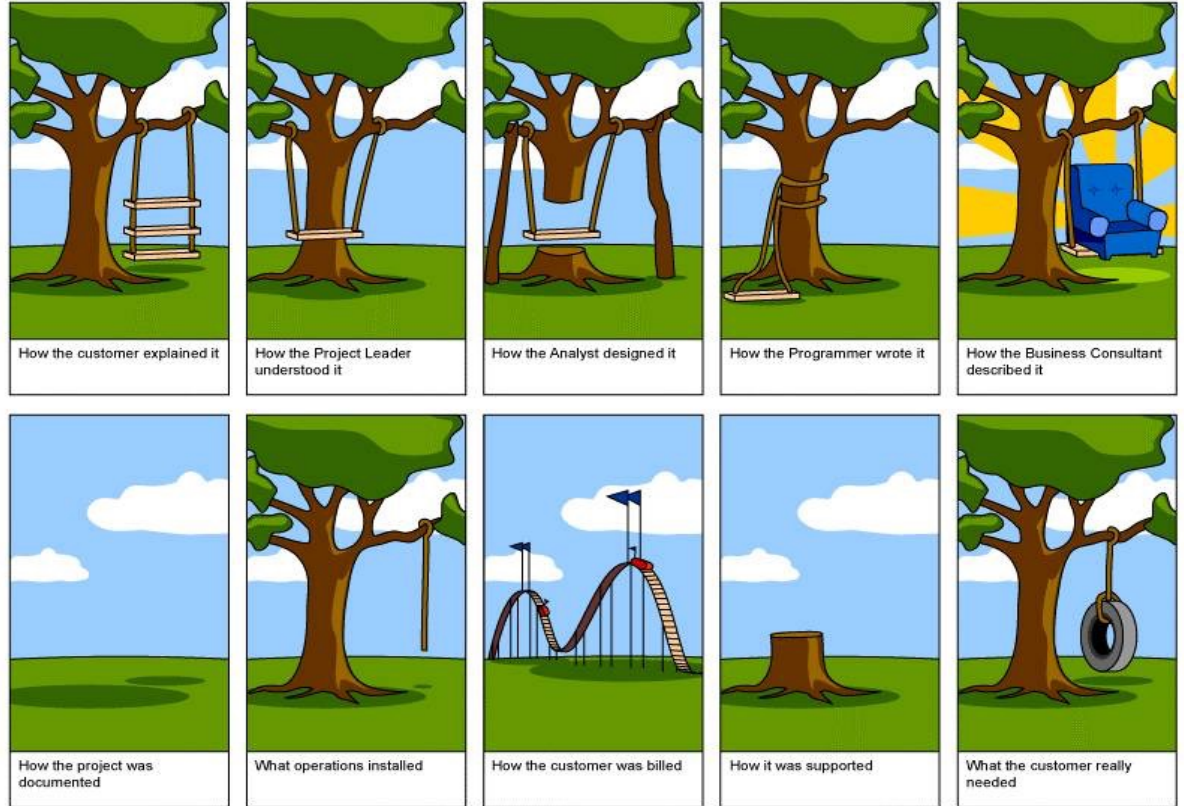

This distinguishes Omnis noCode from almost all other no-code platforms and opens up various options for collaboration for Studio developers.

1

# Omnis noCode - the Prototyping & Communication Tool

# The Prototyping and Communication Tool

We all have seen scenarios like this...

# The Prototyping and Communication Tool

Make sure this won't happen again...

- > Build the prototypes of your apps and new projects in Omnis noCode – this saves time and resources
- > Build the prototypes **together with the future users** in Omnis noCode – this provides clarity, avoids misunderstandings and guarantees success

# The Prototyping and Communication Tool

It's so important to continue to use the noCode product to improve the communication with the business users during the entire life-cycle of the apps.

Real business value is created when the people from the field are in control. These business users know exactly what they want. Omnis noCode should give these users everything they need to take ownership of their business needs.

**2**

# Omnis Studio to Augment noCode Apps

# Augment noCode Apps with Studio

## What distinguishes Omnis from Competition

No-code is great – but can reach its limits

Unlike most other no-code platforms,  
apps built with Omnis noCode are not a dead end  
but can be augmented and further developed with Omnis Studio

By pro developers – Omnis Studio developers

# Augment noCode Apps with Studio

## What distinguishes Omnis from Competition

This opens up many additional opportunities for Omnis developers –

because it's not about building and enhancing one application,

it's about the continuous delivery of all required applications for process modernization and digitization

Bridging  
no-code and  
pro code

# Aligning no-code and pro code

## Option 1: Extension of low-code apps with traditional code libraries

- Business users / citizen developers define their business needs and build an app in Omnis noCode
- The app will be continuously adapted and enhanced according to their own experiences in using it
- When the business requirements grow and get more complex they may not be able to implement the required changes with the noCode product and
- Will involve a pro developer to further develop the solution in Omnis Studio

# Aligning no-code and pro code

## Option 2: Build apps collaboratively

- Business employees and IT design the solution together and IT ensures that the app fits into the existing environment
- Business employees build the app in Omnis noCode
- Business users collaborate with IT rather than bypassing them
- The app will be continuously adapted and enhanced under the governance of IT
- When the business requirements grow and get more complex, IT will be able to take over immediately to further develop the solution in Omnis Studio

# Aligning no-code and pro code

## The Benefits

A collaboration between business users and IT has several benefits:

- Enabling business-side employees to build apps with a no-code platform makes sure that companies and public authorities will be able to clear the backlog of required apps and to meet the demand for faster application delivery.
- Delegating backlogged projects to citizen developers enable IT to focus on more critical and complex projects.

# Aligning no-code and pro code

## The Benefits

- Collaboration between business users and IT creates a culture of shared language and goals and so maximizes the full potential of each department.
- By empowering Citizen Development, the full innovation potential of the organization will be unlocked.
- A very important effect of sanctioning the use of no-code tools by IT is the provision of a regulated environment, control over the business' software activities and the avoidance of a shadow IT.

**Omnis Suite –  
bridging No-Code and Pro Code  
for maximum  
productivity and flexibility**

Omnis Suite =  
Omnis noCode  
& Omnis Studio
